**\*\*Three Sum Problem in Java\*\***  
=====

Here's a Java solution using a two-pointer technique:

```
import java.util.*;

public class ThreeSum {
    public static List<List<Integer>> threeSum(int[] nums) {
        Arrays.sort(nums);
        List<List<Integer>> triplets = new ArrayList<>();
        for (int i = 0; i < nums.length - 2; i++) {
            // Skip duplicates for i
            if (i > 0 && nums[i] == nums[i - 1]) {
                continue;
            }
            int left = i + 1;
            int right = nums.length - 1;
            while (left < right) {
                int total = nums[i] + nums[left] + nums[right];
                if (total < 0) {
```

Session Creation, can select if AI support is needed or not

The screenshot displays the Code\_AI\_ web application interface. On the left, a sidebar titled "Your Chats" lists three chat sessions: "chat\_ai" (7/27/2025, 7:24:01 AM), "new\_session" (7/27/2025, 7:22:38 AM), and "newchat" (7/24/2025, 5:16:01 PM). The main area shows a chat conversation. A user message says "write in java too". An assistant response, dated 7/26/2025, 5:28:39 PM, provides a Java solution for the "Three Sum Problem". A "Create New Session" modal is open in the center, featuring a "Session Name:" input field, a checkbox labeled "Use this session just to keep personal messages", and "Create" and "Cancel" buttons. The bottom of the interface includes a "Type your prompt..." input field and a "Send" button.

\*\*Three Sum Problem in Java\*\*

Here's a Java solution using a two-pointers approach:

```
import java.util.*;

public class ThreeSum {
    public static List<List<Integer>> findTriplets(int[] nums) {
        Arrays.sort(nums);
        List<List<Integer>> triplets = new ArrayList<>();
        for (int i = 0; i < nums.length - 2; i++) {
            // Skip duplicates for i
            if (i > 0 && nums[i] == nums[i - 1]) {
                continue;
            }
            int left = i + 1;
            int right = nums.length - 1;
            while (left < right) {
                int total = nums[i] + nums[left] + nums[right];
                if (total < 0) {
                    left++;
                } else if (total > 0) {
                    right--;
                } else {
                    triplets.add(new ArrayList<>() {
                        add(nums[i]);
                        add(nums[left]);
                        add(nums[right]);
                    });
                    left++;
                    right--;
                }
            }
        }
        return triplets;
    }
}
```
